Abstract

The most profound subduction initiation (SI) event and global plate-motion change since 80 Ma occurred in the Eocene, when Tonga-Kermadec (TK) and Izu-Bonin-Mariana (IBM) SI was synchronous with a change in direction of the Pacific plate (Emperor-Hawaii bend) at c. 50 Ma. The primary goal of our proposal is to precisely date and quantify deformation and uplift/subsidence associated with TK SI in order to test predictions of alternate geodynamic models. We will collect Paleogene sediment cores from strategic locations that constrain seismic-stratigraphic interpretations. We will use sediments, microfossils and geochemistry to reconstruct the paleogeography and climate history of the region for the Cenozoic, with implications for both tectonics and climate research. Tectonic change occurred at the same time in the early Paleogene as Earth reached a Cenozoic pinnacle in greenhouse'climate. Paleoclimate proxy data from this time period show that the greatest global discrepancy with climate model simulations occurs in the southwest Pacific. Hence, a secondary goal is to determine if paleogeographic changes caused by SI may have led to anomalous regional warmth by altering ocean circulation. Late Paleogene and Neogene sediment cores will complement earlier drilling to investigate tropical and polar climatic teleconnections within the mid-latitude transition zone.

Four prominent bathymetric features in the Tasman Frontier region, the Norfolk Ridge (NFR), New Caledonia Trough (NCT), Lord Howe Rise (LHR) and Tasman Basin (TAS), are known from seismic-reflection profiles to contain appropriate sediment archives. However, only three drill sites with limited core recovery have penetrated the middle Eocene and older sequence (DSDP sites 206, 207, 208). Information from these sites in conjunction with seismic-stratigraphic analysis of a large recently-compiled dataset reveals: (1) Cretaceous-Eocene strata are locally deformed, and (2) the LHR and NFR were uplifted, possibly to sea level, during the Eocene and/or Oligocene. We hypothesise that folding of Lower Eocene and older strata in the southwest Pacific, and subsequent uplift of the LHR, were broad-scale consequences of TK SI. We will precisely date deformation, vertical motions, and volcanism, and confirm the magnitude of uplift-subsidence. This will allow us to test geodynamic model predictions, and establish the order and hence causality in relation to regional and global tectonic events.

Scientific Objectives

The Tasman Frontier has untapped potential to address major geoscience problems, because of its strategic location and limited available knowledge.

832 - Full

2

(1) How and why does subduction initiation (SI) occur?

(1a) Did plate convergence precede and induce SI, or did SI happen spontaneously? Observations regarding timing, distribution, and style of deformation will be acquired to test alternative SI model predictions.

(1b) What vertical stresses occurred during SI? The magnitude and timing of uplift and subsidence across a broad region will be determined through drilling targets that will enable evaluation and refinement of geodynamic models. Predictions from seismic stratigraphy of large-magnitude far-field uplift and subsidence challenge existing geodynamic theories, and will be tested.

(2) Did SI influence regional or global climate?

(2a) Why was the Eocene southwest Pacific anomalously warm? New paleogeographic reconstructions and proxy data will be used to refine ocean circulation models in this climate-sensitive region.

(2b) Did SI coincide with Early Eocene warmth? Can SI be linked to global changes in carbon cycling and hence the long-term cooling trend that begins at ~50 Ma.

(3) When did the modern ocean circulation system develop and what role has it played in pole-equator teleconnections through the late Cenozoic. New drilling and paleomagnetic technology will facilitate improved recovery of well-calibrated late Paleogene and Neogene sediment records.

Non-standard measurements technology needed to achieve the proposed scientific objectives.

Standard measurements will be used.
